

## Contact Form Hints:

- When project is finished, export as an HTML5 file

**Hype>File>Export as HTML5**

- Change the html file name.

Delete the name to the left of the . and insert the word index.

Will look like this: **index.html**

- Upload both the

**index.html**

file and the

**YourName.hyperesources**

file to your web server.

I use the free

**Cyberduck**

to do this.

- Upload the

**contact.php**

file to the same location as the other 2 files on your server.

You can change a lot of the text to fit your needs in this php file.

**BBEdit**

is a great free program that you can use to adjust the code.

Note: you'll notice /n and /r in the php code.

\n means new line.

\r means carriage return.

In some ways similar but not entirely.

The character \n writes a newline in UNIX.

While for Windows there is the two character sequence: \r\n.

To be on the safe side use \r\n instead.

- I've also included another file

**contactFormSendMail.js**

This will give you extra input in your contact form that would look like this if the form isn't filled out correctly:

# DESIGN BEACON

Required

Your Name: Don King

Invalid Address

Your Email: don@donkingartist.com

Required

Message: This is the text of the message.
